

Daily Routine Hybrid • Feature Documentation

Routinely App Guide

A colourful, easy-to-understand walkthrough of the Android app's reminders, wellness dashboard, health integrations, plans, reports, and background sync features.

Core idea

Help users build consistent daily routines for meals, workouts, water, sleep, mindfulness, and personal tasks.

Health focus

Tracks steps, sleep, calories, distance, weight, water intake, heart points, and wellness scores.

Smart scheduling

Supports exact reminders, interval reminders, notification actions, snoozing, and boot restore.

Tech foundation

Kotlin Android app using XML layouts, Material components, Health Connect, Google Fit, WorkManager, and SharedPreferences.

Prepared from workspace source review • Generated July 3, 2026

OVERVIEW

What this app does

Daily Routine Hybrid, presented in the report as **Routinely**, is an Android wellness companion. It combines daily reminder management with health tracking, meal planning, workout planning, progress scoring, profile metrics, and shareable wellness reporting.

9

Reminder categories

11

Main app screens

180

Days of health history support

19+

Known fitness apps scanned

Simple explanation

The app is designed for someone who wants one place to remember daily habits, plan food and exercise, connect health data, view progress, and export wellness information.

CONTENTS

1. Dashboard

Today's summary and quick actions

2. Reminders

Meals, workouts, hydration, sleep, tasks

3. Diet planning

Meals, calories, templates

4. Workout planning

Exercises, intensity, MET burn

5. Health tracking

Steps, heart points, sleep, weight, calories

6. Integrations

Health Connect, Google Fit, fitness app scanner

7. Wellness score

Weighted score out of 100

8. Reports & architecture

PDF report, storage, workers

FEATURE SET

Main features, one by one

1. Home dashboard

Shows today's wellness snapshot, routine progress, reminders, health sync status, water intake, and navigation cards for major health areas.

[Today view](#)[Progress](#)

2. Reminder manager

Create, edit, view, enable, hide, or delete reminders. Reminders can use fixed times, repeat days, monthly days, or interval-based repetition.

[Fixed time](#)[Interval](#)

3. Diet plan

Plan meals by calendar date, including meal name, description, time, meal type, calories, and optional reminder synchronization.

[Calories](#)[Meal templates](#)

4. Workout plan

Plan exercises per date with sets, reps, target area, intensity, reminder time, and MET estimation for burn calculations.

[Intensity](#)[Burn estimate](#)

5. Walking data

Tracks steps, distance, move minutes, and heart points with Today, Weekly, and Monthly graph-style views.

[Steps](#)[Heart Points](#)

6. Sleep tracking

Reads or stores sleep hours, contributes to the daily wellness score, and uses an 8-hour target in scoring.

[Sleep hours](#)[Score input](#)

7. Weight and profile

Users can store age, height, weight, gender, and weight history. Profile metrics calculate BMI, BMR, ideal calories, and ideal weight.

[BMI](#)[BMR](#)

8. Water tracking

Daily water intake is stored by date and can be adjusted from the app and surfaced through the wellness widget.

[Daily log](#)[Widget](#)

REMINDERS

Routine reminders and notifications

Reminder functionality is the foundation of the app. It helps users turn health goals and daily responsibilities into scheduled actions.

Reminder type	Purpose	Default user message
Meal Time 🕒	Breakfast, lunch, dinner, snack, or custom food reminder.	Eat healthy and mindfully.
Exercise 💪	Workout or movement sessions.	Time to get moving.
Hydration 💧	Regular water intake.	Stay hydrated.
Sleep 😴	Bedtime and wind-down prompts.	Get restful sleep.
Meditation 🧘	Mindfulness breaks.	Take a mindful break.
Daily To Do's 📅	Everyday productivity tasks.	Check today's tasks.
Weekend Tasks 🏠	Weekend goals and chores.	Remember weekend goals.
Monthly Tasks 📅	Monthly reviews or recurring monthly habits.	Review monthly progress.
Custom 🕒	Anything the user wants to schedule.	Scheduled activity reminder.

Scheduling options

Reminders can run at a specific hour/minute, repeat on selected days, repeat monthly on a day of month, or run as interval reminders every configured number of minutes.

Notification actions

Notifications include **Done** and **Snooze** actions. Done records progress; Snooze delays the reminder without requiring users to open the app.

Boot restore

A boot receiver restores enabled reminders after a device restart, so reminders continue working after reboot or quick boot events.

Hidden plan reminders

Meals and exercises can sync into the reminder system as hidden reminders, keeping plan-based alerts working without cluttering the main reminder list.

PLANNING

Diet plan and workout plan

Calendar-first planning

Both meals and exercises are stored against specific dates, allowing the user to plan different routines for different days.

1

Meal entries

Each meal can contain a name, description, time, meal type such as Breakfast/Lunch/Dinner/Snack, calorie value, and reminder toggle.

2

Meal templates

Users can create, rename, duplicate, delete, and apply meal templates. Template durations include weekly, 10 days, fortnight/bi-weekly, and monthly ranges.

3

Exercise entries

Each exercise can include name, sets, reps or duration, target area, intensity from 0 to 100, time, reminder toggle, MET estimate, and MET source.

4

Workout templates

Workout templates can be built from existing date ranges and applied to future ranges with overlap checks to avoid accidental conflicts.

5

Progress connection

Completed meals and exercises contribute to nutrition and workout parts of the wellness score, making planning directly visible in daily progress.

Implementation detail: The planning system is managed by **PlanManager** and stored with Gson in SharedPreferences. It supports date-keyed meal and exercise lists plus applied template ranges.

HEALTH TRACKING

Health data and integrations

The app combines local wellness data with Android health integrations so users can view meaningful daily and historical trends.

Health Connect

Reads steps, sleep, active calories, total calories, basal metabolic rate, distance, exercise sessions, weight, historical data, and background health data when permissions allow.

Google Fit Heart Points

Uses Google Sign-In fitness scopes to read raw and aggregate Heart Points, including daily buckets for history.

Fitness app scanner

Detects installed fitness apps such as Google Fit, Samsung Health, Fitbit, Garmin, Xiaomi, Zepp, NoiseFit, boAt, Huawei Health, Withings, Suunto, Polar, and more.

Historical storage

Keeps historical values for steps, sleep, calories, heart points, and weight. Health sync history is designed around a 180-day window.

Data area	What the app uses it for	Default/logic
Steps	Dashboard, walking screens, active calorie estimate, wellness score.	Default daily step goal: 10,000.
Distance	Walking speed and burn estimate.	Fallback estimate: steps × 0.76m.
Move minutes	Walking burn estimate if available.	Fallback estimate: steps ÷ 100.
Sleep	Sleep screen and wellness score.	Scoring target: 8 hours.
Calories	Calories screen, wellness report, daily balance.	Default daily calorie goal: 2,000.
Weight	Weight history, BMI, BMR, ideal weight calculations.	Uses profile weight if daily weight missing.

SCORING AND INSIGHTS

Wellness score and profile metrics

The app turns several daily signals into a score out of 100, while also calculating personal health metrics from the user profile.

Default score weighting

Weights can be customized by the user in the score customization screen.

Sleep

Workout

Nutrition

Steps

How scoring behaves

If a data area has no logged/planned data, the active factors are rescaled instead of unfairly punishing the user. The final score is clamped between 0 and 100.

Sleep progress

Workout completion

Nutrition completion

Step goal progress

Profile calculations

Profile metrics include BMI category, BMR using Mifflin-St Jeor style formulas, ideal weight, and ideal daily calories rounded to the nearest 50.

Trend insight

The wellness engine compares current-week and previous-week step totals to generate friendly weekly movement insights.

Why this matters

Instead of only listing raw numbers, the app translates routine completion and health data into motivation: "keep moving," "good start," "great job," and similar dashboard feedback.

REPORTS AND BACKGROUND SERVICES

Reports, widget, sync, and permissions

180-day wellness PDF report

The in-app report generator creates a shareable PDF with daily rows for steps, intake, burned calories, net calories, sleep, weight, BMI, notes, and summary totals.

Wellness widget

A home screen widget displays wellness information and supports quick actions such as adding water.

Background health sync

A WorkManager worker syncs health data in the background and supports modes such as all data, steps-only, sleep-only, and history-focused sync.

Permission flow

The app requests notifications, exact alarms, Health Connect permissions, and Google Fit access when needed. It checks permissions before reading data.

ARCHITECTURE AT A GLANCE

Area	Main implementation	Role
UI	Kotlin Activities + XML layouts	Dashboard, reminders, plans, health screens, score customization, profile, signup.
Persistence	SharedPreferences + Gson	Stores reminders, profile settings, plans, templates, health history, water intake, score history.
Scheduling	AlarmManager + BroadcastReceiver	Exact reminders, done/snooze actions, boot restoration.
Background work	WorkManager	Periodic or requested health data synchronization.
Health APIs	Health Connect + Google Fit	Reads health metrics and Heart Points with user permission.
Sharing	Android PdfDocument + FileProvider	Generates and shares wellness PDF reports safely.

USER JOURNEY

How a user would experience the app

1

Sign up and set profile

The user starts with basic onboarding, then fills in profile data such as name, age, height, weight, and gender for personalized metrics.

2

Connect health sources

The app scans known fitness apps, requests Health Connect access, and can request Google Fit Heart Points permission.

3

Plan the day

The user adds meals, workouts, water goals, sleep reminders, meditation prompts, to-dos, or custom routines.

4

Receive reminders

Scheduled notifications appear at the right time. The user can mark them Done or Snooze them directly from the notification.

5

Review progress

The dashboard and detail screens show health data, completion progress, score, and weekly/monthly walking trends.

6

Export wellness history

When needed, the user can generate a 180-day wellness report PDF for review, sharing, or personal record keeping.

Research sources reviewed: README, AndroidManifest, app activities, reminder models/managers, plan models/managers, HealthDataManager, HealthConnectManager, GoogleFitHeartPointsManager, HealthSyncWorker, WellnessEngine, WellnessScoreManager, ProfileHealthMetrics, WellnessReportManager, widget and receiver declarations.

QUICK REFERENCE

Feature reference summary

Feature	Plain-language description
Dashboard	Central home screen for today's wellness and quick navigation.
Reminders	Daily, weekly, monthly, fixed-time, and interval alerts for routines.
Done/Snooze	Notification actions that let users respond immediately.
Diet planning	Date-based meal planning with calories and templates.
Workout planning	Date-based exercise planning with sets, reps, intensity, reminders, and burn estimates.
Water intake	Daily hydration tracking with quick adjustments and widget support.
Walking data	Steps, distance, move minutes, heart points, and historical views.
Sleep tracking	Sleep values that feed the sleep screen and wellness score.
Weight tracking	Daily weight history plus BMI and related profile calculations.
Calories tracking	Goal-based calorie tracking and active burn calculations.
Health Connect	Android health data integration for major wellness metrics.
Google Fit Heart Points	OAuth-based Heart Points reading from Google Fit.
Wellness score	Customizable score out of 100 based on sleep, workouts, nutrition, and steps.
Profile	Stores personal information and computes BMI, BMR, ideal calories, ideal weight.
PDF report	In-app 180-day wellness report with daily rows and summary totals.
Background sync	Network-aware WorkManager sync of health history and selected data modes.

This document describes the current workspace implementation, not a future roadmap.
